

FEMALE HORMONE PROFILE (spot urine)

Hormone imbalances are associated with numerous symptoms and health conditions. Assessing and diagnosing these changes are important to decrease unnecessary suffering and prevent degenerative diseases. Female hormones fluctuate through a menstrual cycle and at various times of a woman's life. Imbalances in hormones are associated with PMS, menopause and more complex conditions like PCOS and endometriosis. This test provides a focused overview of the hormonal cascade of both male hormones and female hormones.

SYMPTOMS AND CONDITIONS ASSOCIATED WITH HORMONE IMBALANCE

PMS	Menopause
Fertility issues	Adrenal stress
Endometriosis	PCOS
Uterine fibroids	Fibrocystic breasts
Hormonal cancers	Osteoporosis
Fatigue	Insomnia

Urinary Hormone Testing

Urine testing has the benefit over serum testing that it detects predominantly unbound, active hormones, which are biologically available to their receptors in target tissues. It has a convenient, painless collection procedure that can be performed in the privacy of the home. Urine testing is a stress free, no needles collection that measures metabolic breakdown of hormones. This comprehensive test identifies androgens, female hormones, adrenal hormones and thyroid hormones.

ADVANTAGES OF URINARY HORMONE TESTING

Measures the free, bioavailable fraction of hormones
Measures metabolites of hormones providing a detailed metabolism of hormones
Do-it-yourself at home collection offers ease of collection for patient
